nfpa 99 pdf: Hospital Safety Index World Health Organization, 2017-01-15 This guide provides a step-by-step explanation of how to use the Safe Hospitals Checklist, and how the evaluation can be used to obtain a rating of the structural and nonstructural safety, and the emergency and disaster management capacity, of the hospital. The results of the evaluation enable hospital's own safety index to be calculated. The Hospital Safety Index tool may be applied to individual hospitals or to many hospitals in a public or private hospital network, or in an administrative or geographical area. In some countries, such as Moldova, all government hospitals have been evaluated using the Hospital Safety Index. In this respect, the Hospital Safety Index provides a useful method of comparing the relative safety of hospitals across a country or region, showing which hospitals need investment of resources to improve the functioning of the health system. The purpose of this Guide for Evaluators is to provide guidance to evaluators on applying the checklist, rating a hospital's safety and calculating the hospital's safety index. The evaluation will facilitate the determination of the hospital's capacity to continue providing services following an adverse event, and will guide the actions necessary to increase the hospital's safety and preparedness for response and recovery in case of emergencies and disasters. Throughout this document, the terms safe or safety cover structural and nonstructural safety and the emergency and disaster management capacity of the hospital. The Hospital Safety Index is a tool that is used to assess hospitals' safety and vulnerabilities, make recommendations on necessary actions, and promote low-cost/high-impact measures for improving safety and strengthening emergency preparedness. The evaluation provides direction on how to optimize the available resources to increase safety and ensure the functioning of hospitals in emergencies and disasters. The results of the evaluation will assist hospital managers and staff, as well as health system managers and decision-makers in other relevant ministries or organizations in prioritizing and allocating limited resources to strengthen the safety of hospitals in a complex network of health services. It is a tool to guide national authorities and international cooperation partners in their planning and resource allocation to support improvement of hospital safety and delivery of health services after emergencies and disasters. Over the past three years, the expert advice of policy-makers and practitioners from disciplines, such as engineering, architecture and emergency medicine, has been compiled, reviewed and incorporated into this second edition of the Guide. Global and regional workshops and virtual consultations have enabled technical and policy experts to contribute to the revision of Hospital Safety Index until consensus was reached on the content for its publication and distribution. Further comments and observations are certain to arise as the Hospital Safety Index continues to be applied across the world and these experiences will enable us to improve future editions. The rapid diagnostic application of the Hospital Safety Index provides, as a comparison, an out-of-focus snapshot of a hospital: it shows enough of the basic features to allow evaluators to confirm or disprove the presence of genuine risks to the safety of the hospital, and the hospital's level of preparedness for the emergencies and disasters to which it will be expected to provide health services in the emergency response. The Hospital Safety Index also takes into account the hospital's environment and the health services network to which it belongs. This second version of the second edition was released in December 2016.

nfpa 99 pdf: Nfpa 99: Health Care Facilities Code, 2012 Edition Nfpa, 2011-08-01 Featuring a groundbreaking shift to a risk- vs. occupancy-based approach, the 2012 NFPA 99 ushers in a new era in health care safety! In response to an increasingly decentralized health care system, a growing array of high-tech procedures, and new security demands, the 2012 NFPA 99 has reinvented itself to reflect a new environment where it is the risk that a procedure poses to patients and staff, not the location where it is conducted, that defines safety guidelines. Its new title -- Health Care Facilities Code -- signifies that it is rewritten to make performance criteria for health care facilities more enforceable and adoptable. Completely reorganized, this new benchmark advances health care facility safety with major changes such as... * A new risk-based framework * A fully updated Chapter 5, Gas and Vacuum Systems, including additional maintenance requirements * New chapters on security, fire protection, and information technology * Operating rooms are considered a wet location unless a risk assessment of the area determines otherwise. Move up to a new level of protection and keep facilities up-to-code and patients and staff safe from harm. The 2012 NFPA 99 is essential for engineers, facility managers...AHJs...plumbers...gas and vacuum system installers, designers, and verifiers...security personnel...insurance companies...and manufacturers. nfpa 99 pdf: Hyperbaric Facility Safety, 2nd Edition W.T. Workman, J. Steven Wood, 2020-03-01 When the first edition of Hyperbaric Facility Safety, A Practical Guide was published it became an integral part of virtually every hyperbaric facility's reference library, serving as the go-to standard for a hyperbaric safety program. In this second edition, editors W.T. "Tom" Workman and J. Steven "Steve" Wood have endeavored to establish a comprehensive balance between those hyperbaric providers who have a keen interest in the underlying design standards and regulatory framework and those who need to "get it done." The second edition is structured into two parts. The first part explains the various regulatory agencies that may influence the field of hyperbaric medicine (including international perspectives), while the second part emphasizes a nuts-and-bolts approach to hyperbaric safety program development and how the safety program integrates all aspects of a hyperbaric facility. The editors, along with the 80 chapter authors and contributors bring experiences from clinical hyperbaric medicine, the U.S. Air Force and Navy, the UHMS Hyperbaric Facility Accreditation program, hyperbaric chamber engineering, manufacturing, and regulatory/standards development.

nfpa 99 pdf: Strengthening the Disaster Resilience of the Academic Biomedical Research Community National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Health and Medicine Division, Institute for Laboratory Animal Research, Board on Earth Sciences and Resources, Board on Health Sciences Policy, Committee on Strengthening the Disaster Resilience of Academic Research Communities, 2017-11-20 The academic biomedical research community is a hub of employment, economic productivity, and scientific progress. Academic research institutions are drivers of economic development in their local and state economies and, by extension, the national economy. Beyond the economic input that the academic biomedical research community both receives and provides, it generates knowledge that in turn affects society in myriad ways. The United States has experienced and continues to face the threat of disasters, and, like all entities, the academic biomedical research community can be affected. Recent disasters, from hurricanes to cyber-attacks, and their consequences have shown that the investments of the federal government and of the many other entities that sponsor academic research are not uniformly secure. First and foremost, events that damage biomedical laboratories and the institutions that house them can have impacts on the safety and well-being of humans and research animals. Furthermore, disasters can affect career trajectories, scientific progress, and financial stability at the individual and institutional levels. Strengthening the Disaster Resilience of the Academic Biomedical Research Community offers recommendations and guidance to enhance the disaster resilience of the academic biomedical research community, with a special focus on the potential actions researchers, academic research institutions, and research sponsors can take to mitigate the impact of future disasters.
